# What is the problem statement?

---

- Farmers are **not able to sell** their crops to anyone they have to visit sell it to agents in **APMC markets**.
  - Agents buy crop at **less rate** but **increased rate** the rate when selling to wholesalers.
  - Truck drivers are not getting enough **transport deals** due to lack **advance infrastructure**.
- 

# Objectives

---

1. Providing an Infrastructure to customer and driver to directly communicate regarding transportation requirements.
  2. Providing opportunity to all truck drivers to make offers for all available shipments.
  3. To give opportunity for farmers to decide the minimum price of shipment and also give equal opportunities to customers including APMCs, government agencies, etc. and truck drivers throughout the country.
  4. Make easy payments and more secure transport service for both farmers and drivers.
- 

# Present condition-

---

- Current options available for same procedure -

**APMC**

# Literature Review

---

- Recently, there are some developments done in some parts of this field like **transporting** and **tracking management systems** with the help of **greedy like algorithms**, but till date there is **no efficient effort** has been made in this area to solve the problem. There is a strong requirement for a one-stop solution for this problem. [2]
  - The basic idea behind our application is that both Farmers and Consumers can **search for their needs** and get more benefits through our application. Our application helps farmers get different options to **sell their products** in their locations that **reduce transportation costs**. [1]
  - In our application, we will make use of **Time Series data** that converts to time series by using point process. Our model predicts the probability of a crop that has the highest price.[1]
  - **Forecasting** is a process of making predictions of the future based on past and present data. The common method of Prediction is the **ARIMA model**, which stands for Auto Regressive Integrated Moving Average. [1]
- 

# What is our idea?

---

- We are providing a **e-platform** to **Farmers** where they can sell their crops to **anyone** on their desired rate and conditions.
  - They will not be bounded to sell crop to **APMC agents** who usually rob them with low price to their crops.
  - On the other hand **Wholesaler** who buys from these **APMC agents** can directly buy from farmers. It will remove the cost added by APMC agents.
  - And, for transport **Truck Drivers** can see the successful deals on platform and can transport the crop from **Farmers** to **Wholesaler**
- 

# So who and all are stakeholder?

---

**Farmers**

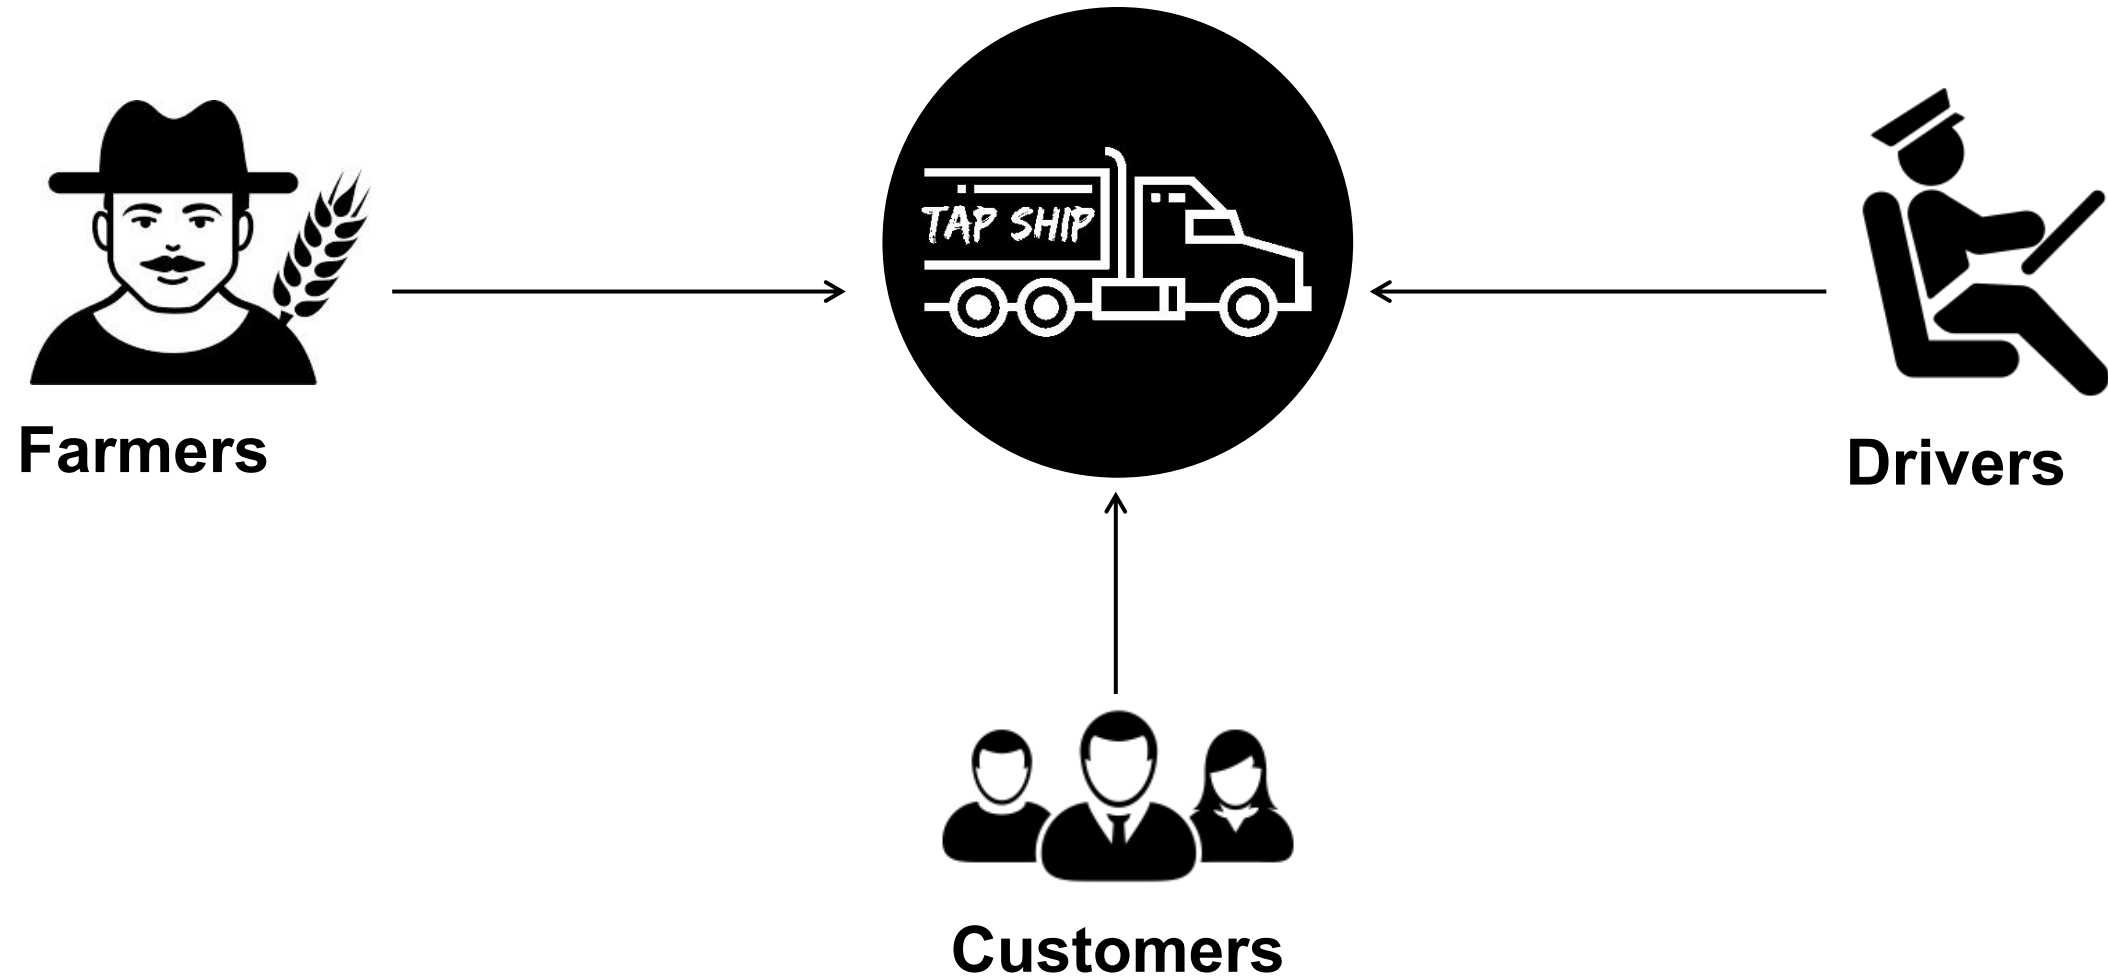

**Customers**

**Drivers**

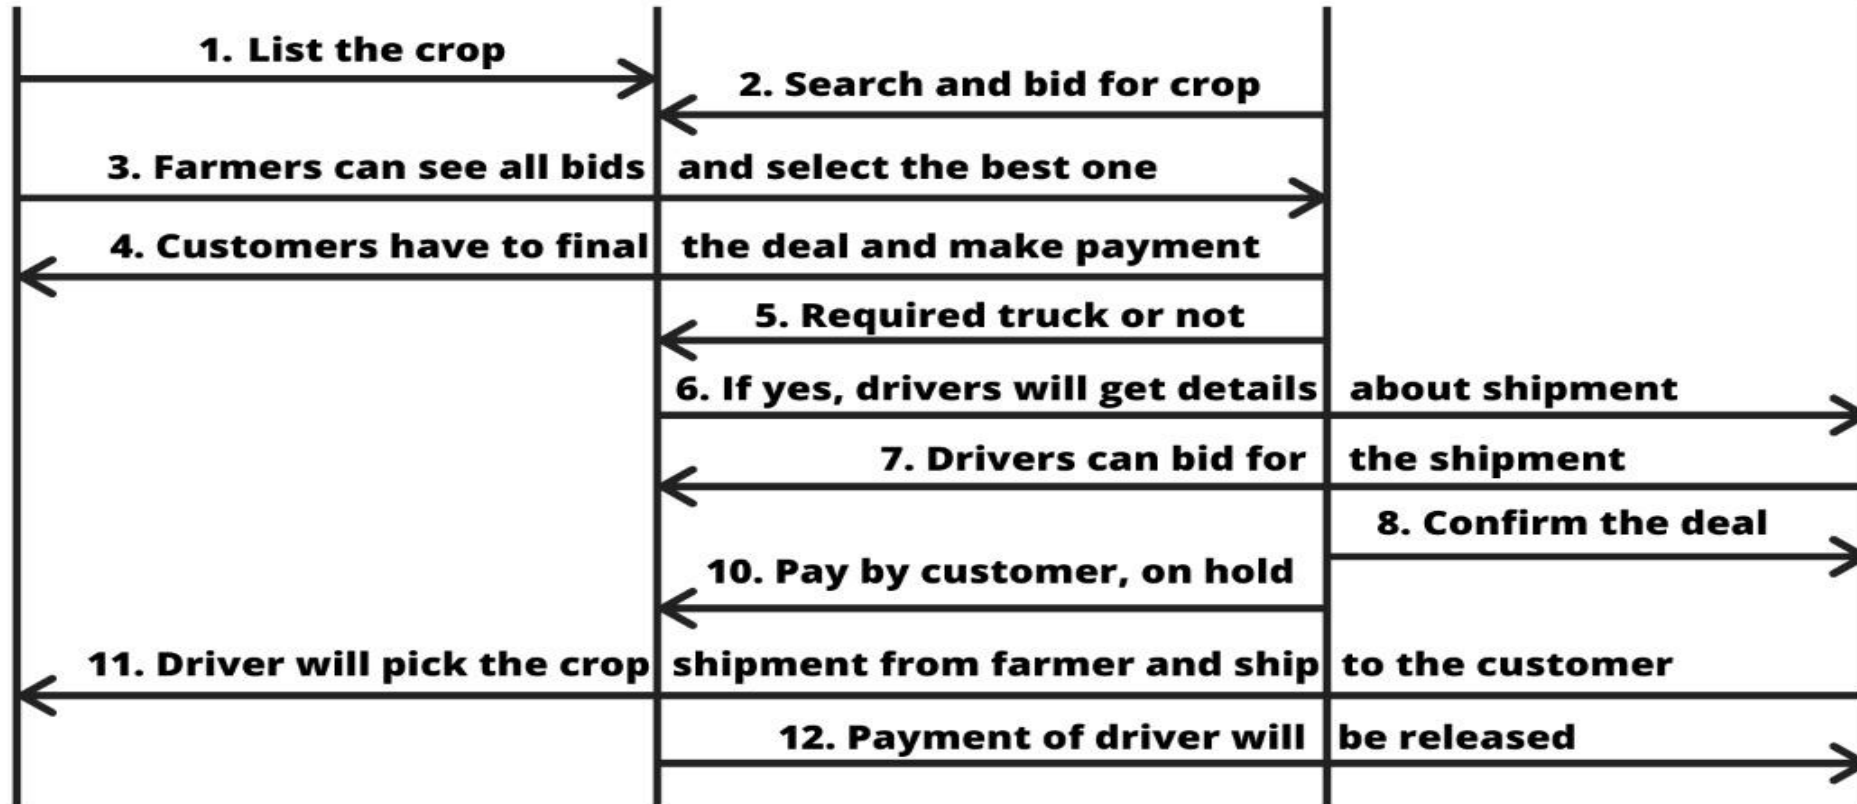

# So what is solution?

---

# How it works?

# Why we need new system?

---

**APMC:** 1.Cess tax,  
2.Broker fee,  
3.Visit mandi,  
4.Low price,  
5.High retail Price

**eNAM:** 1.Visit mandi,  
2.No control on price,  
3.Waiting

**Kisan Rath:** Not integrated with other system

# Benefit of new system on Society:

---

- It will remove **Cess tax** applied by **APMC** which is around 1% to 8%
  - Farmers will be the only person who can **decide price** of their crops.
  - Agents **can't rob** farmers by selling crop to lower price simply.
  - Farmers are **not bounded** to a fix trade area they can trade anywhere.
  - Farmers will get payment on **same day** of deal.
  - Wholesaler can get crop on **less price** compare to existing system.
  - Truck drivers can get **transport work** easily.
  - Agri-Transport will be lot **cheaper** compare to now-a-days.
- 

# Challenges to new system?

---

- **Challenge 1:** Quality assurance
    - How can a customer trust on farmer that he or she will provide the same quality which is expecting by the customer.
    - How can a farmer get rid by customer's fraud about crop quality after delivery.
  - **Challenge 2:** Lack of Awareness and Literacy
    - How to deal with challenge of Awareness and Literacy among farmers?
  - **Challenge 3:** Lack of Availability of Resources
    - How to deal with unavailability of resources like modern gadgets and network connectivity.
- 

# Then what will happen to APMC?

---

- **APMC** can still work.
  - They can use platform as **Customers**. (We will have option as type of customers)
  - **APMC** will be more transparent as they need compete with all other customers.
  - **APMC** can be used by a fixed trade area with some kind of extra benefits to farmers.
-
